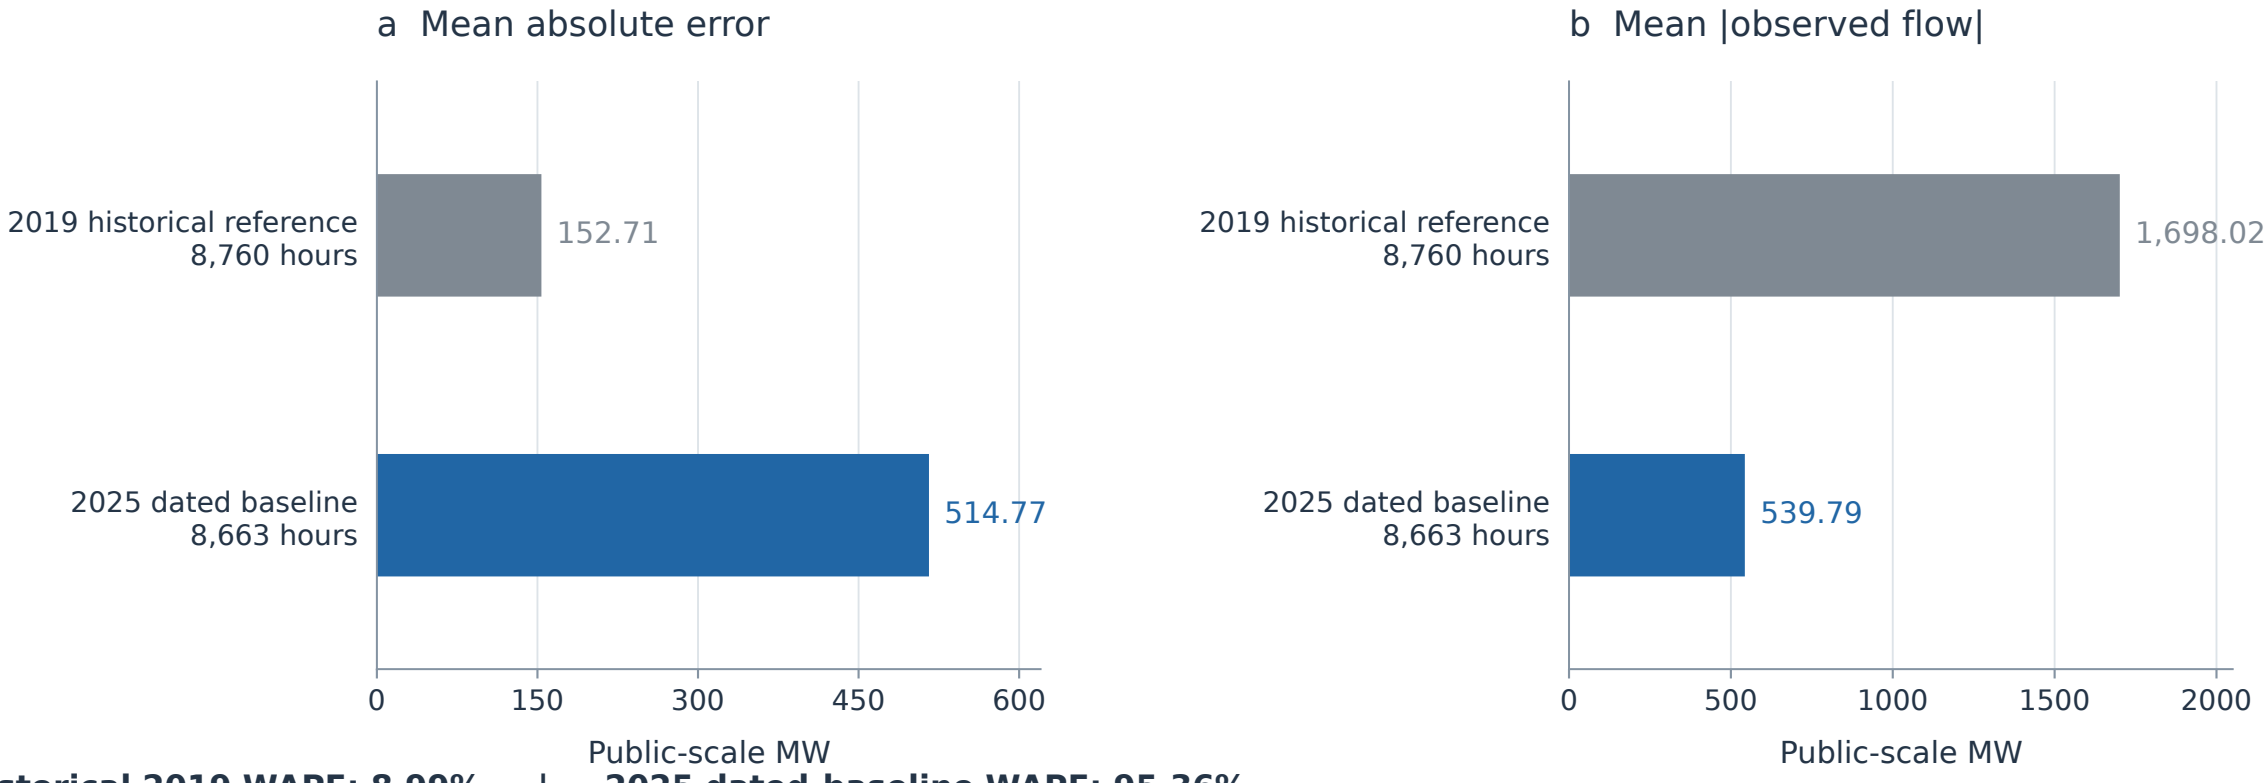
# Moses South: historical context

WAPE depends on both absolute error and the magnitude of observed flow.



**Historical 2019 WAPE: 8.99%** | **2025 dated-baseline WAPE: 95.36%**

Historical context only: these are different years, operating conditions, source-processing conventions and hour cohorts.

This is not a controlled before/after repair comparison. The confirmed 2025 repair comparison uses the same 8,663 hours in the companion figure.

Sources: frozen 2019 full_year.mat and full_year_interface_metrics.csv; 2025 comparison/interface_summary.csv. Lower error is better.
