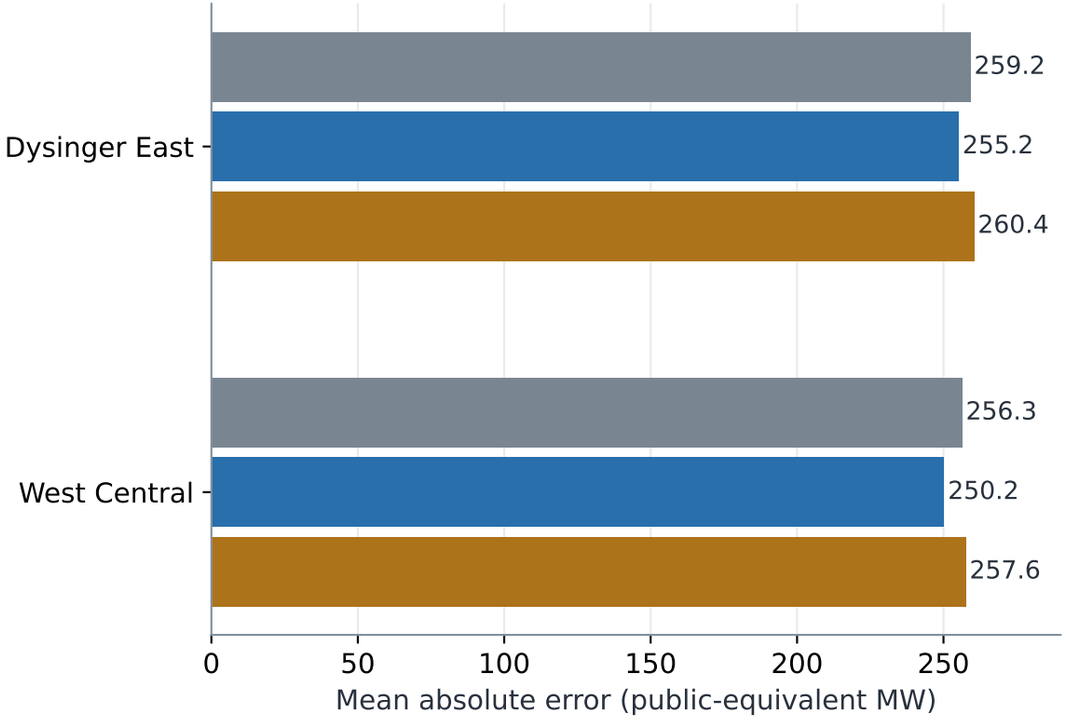
Controlled western-flow tests, 2025

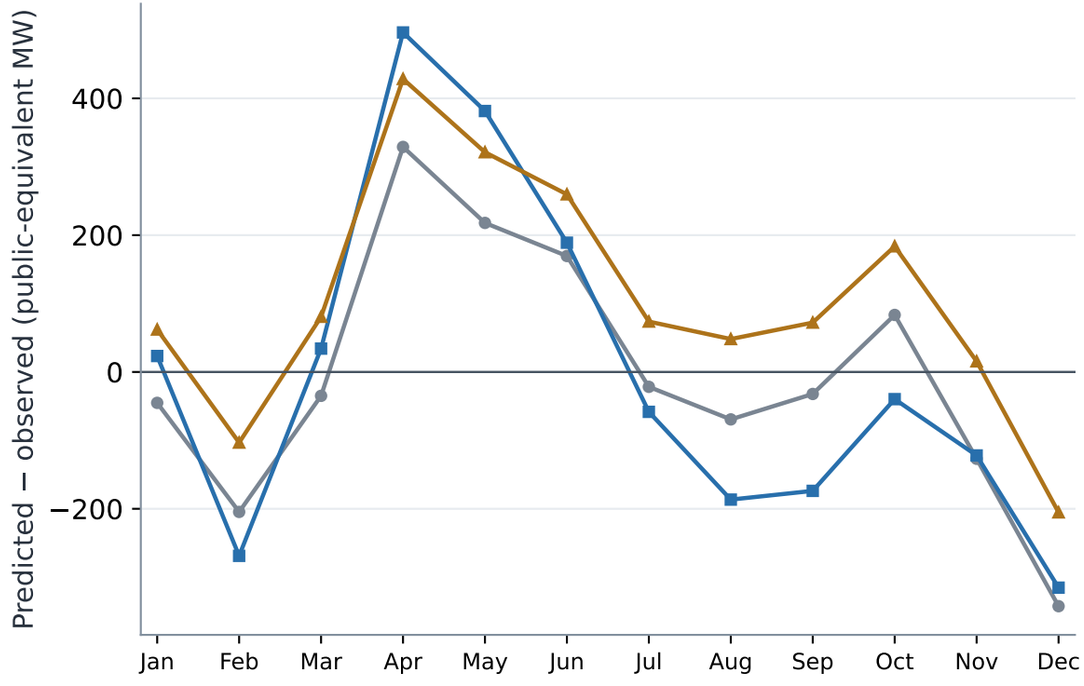
8,651 identical hours • fixed external flows and zonal loads • dated topology • no interface fitting

Baseline
Bounded legacy Niagara rule
EIA monthly mean; same hourly shape

Annual western MAE



Dysinger monthly signed bias



Niagara changes are balanced by other conventional hydro outside Zones A/B. St. Lawrence and pumped storage remain fixed.
The legacy hypothesis is explicitly capacity-bounded in 277 hours. The monthly case tests a source mean, retaining the baseline shape.
Within-zone load tests and independent zone-cut operators leave both western predictions unchanged; physical gate membership remains unresolved.
